In Arshia Azizpour's framework (**Trade City Pro**), the **3-SMA System** consists of three Simple Moving Averages: **7 SMA**, **25 SMA**, and **99 SMA** 1, 2.
This combination was originally selected because 7, 25, and 99 were the historical default moving averages on Binance, meaning massive retail volume and automated trading algorithms base their execution and order routing around these exact levels 3, 4. Additionally, using the 99 SMA provides a one-candle lead over market participants watching the standard 100 SMA 3.
The three parameters fulfill distinct quantitative functions within the strategy:

1. The Individual SMA Parameters & Roles

- **7 SMA (Yellow Line) — Immediate Momentum & Dynamic Trigger Anchor** 5:
- **Proximity**: Sticks tightly to price candles across virtually its entire lifecycle; price rarely detaches from the 7 SMA for long without snapping back 5.
- **Trend Velocity & Slope**: The angular slope of the 7 SMA measures short-term trend speed 6, 7. When its slope flattens toward \\(0^\circ\\) (horizontal), immediate trend momentum has ceased, signaling trend weakness or the onset of consolidation 6-8.
- **Candle Setup Anchor**: Serves as the dynamic validation line for the proprietary 15-minute **Candle Setup** 9, 10. The 7 SMA must sit directly behind the candle, supporting its rejection wick, and **must never cut through the candle's real body** 9, 11.
- **Watchlist Filter**: Used on higher timeframes (such as the Weekly chart) to build candidate watchlists—assets closing their candle above the 7 SMA are queued for Long setups, while those closing below are queued for Short setups 12.
- **25 SMA (Blue Line) — Intermediate Structure & Dynamic S/R** 5, 13, 14:
- **Dynamic Support/Resistance**: Functions as a major dynamic S/R zone where intermediate pullbacks terminate 14, 15.
- **Position Holding & Trailing Anchor**: As long as the 25 SMA slopes steeply in the direction of the trade, positions can be held for higher Risk-to-Reward multiples (e.g., \\(5R\text{–}10R+\\)) 16, 17. Once the 25 SMA begins to flatten or curl in the opposite direction, it triggers systematic profit-taking 15, 18.
- **Trend Health**: Can separate from price candles during strong trends without invalidating the move, offering pullback re-entry opportunities 14.
- **99 SMA (Red Line) — Macro Cycle Anchor & "The Black Hole"** 5, 18:
- **Gravitational Pull**: Acts as a gravitational baseline 1, 18. When price overextends too far from the 99 SMA, mean-reversion pressure builds 1, 18. Price will either pull back sharply toward the 99 SMA or trade sideways in a prolonged range until the 99 SMA catches up 1, 18.
- **Overextension Guard**: New breakout trades in the direction of an overextension are restricted when price is stretched far from the 99 SMA 1.
- **Macro Trend Filter**: Acts as a directional governor 19, 20. Bullish Candle Setups are avoided if price is below the 99 SMA, and bearish setups are avoided if price is above the 99 SMA 19, 20.

2. Parameter Alignment & System Rules

- **Trend Alignment Architecture**:
- **Bullish Alignment**: \\(\text{Price} > 7\text{ SMA} > 25\text{ SMA} > 99\text{ SMA}\\) with all three lines sloping upward 1, 21.
- **Bearish Alignment**: \\(\text{Price} < 7\text{ SMA} < 25\text{ SMA} < 99\text{ SMA}\\) with all three lines sloping downward 1.
- When price breaks horizontal resistance and the setup candle closes above all three moving averages (7, 25, and 99), it adds an extra layer of confluence, justifying standard or higher-conviction risk sizing 21.
- **Crossover Dynamics (Conformation, Not Entry)**:
- A lower-period SMA crossing above a higher-period SMA (e.g., 7 crossing 25, or 25 crossing 99) confirms sustained bullish acceleration 22, 23.
- Moving average crossovers are **never used as direct entry triggers** because they lag price displacement significantly 17, 24. Instead, entries are taken earlier via price action triggers (S/R breaks and Candle Setups), while crossovers serve as confirmation to keep trades open for larger targets 13, 17.
- **The Entanglement / Choppy Market Filter ("Bazare Chert")**:
- When the 7, 25, and 99 SMAs flatten and repeatedly cross/weave through one another, the market is classified as a range-bound, low-liquidity chop 7, 8, 13.
- In this state, moving average crossovers produce false signals and breakout orders are disabled until clear separation resumes 8, 13, 25.
