Converting the full trading system taught across all 94 videos of **Trade City Pro (Arshia Azizpour)** into an algorithmic specification requires formalizing its quantitative logic: **Trend & Cycle Architecture**, **Entry Setups & Filters**, **Execution via Stop-Trigger Orders**, and **Mathematical Risk & Profit Management**.
Because extracting and outlining all 94 individual video curricula in complete algorithmic detail exceeds the capacity of a single message, here is the **Master Algorithmic System Blueprint** synthesized directly from the sources, followed by the **Video-by-Video Outlining Plan** and the detailed breakdown of the first batch (**Videos 1 through 10**).

The Master Algorithmic Architecture

1. System Philosophy & Edge

- **Trader Profile**: Pure **Momentum & Breakout Trend Follower** 1-3. The strategy never attempts counter-trend mean reversion or catching falling knives 4-6.
- **Order Execution Paradigm**: Exclusively utilizes **Stop-Market (Trigger-Market)** orders 7-10. Limit orders and raw market orders are avoided for breakouts because liquidations and stop runs create violent slippage and rapid momentum ("whale movements") that can only be captured automatically 3, 7, 10, 11.
- **Timeframe Hierarchy**: Multi-timeframe top-down alignment:
- **Macro / Trend Direction**: Monthly & Weekly (HWC – High Wave Cycle) 12-14.
- **Market Structure & S/R Mapping**: Daily & 4-Hour (MWC – Medium Wave Cycle) 13-15.
- **Execution & Trigger Timeframe**: 15-Minute (LWC – Low Wave Cycle) 15-18.

2. Quantitative Setup Logic & Triggers

A. The Primary "Candle Setup" (Flagship Entry Engine)

- **Trend & Wave Requirement**: Executed strictly in the direction of the higher timeframe trend, ideally during the **second impulse wave (Second Wave)** following an initial consolidation breakout or pullback 17-19.
- **Candle Geometry**:
- **Wick-to-Body Ratio**: Rejection wick must be \\(\ge 1.5\times \text{ to } 2.0\times\\) the size of the real body 20. For Long entries: bottom wick; for Short entries: top wick 20.
- **Small Opposite Wick**: Minimal or zero wick on the advance side 21, 22.
- **Dynamic Moving Average Filter (7 SMA)**:
- 7-period Simple Moving Average must slope in the trade direction 23.
- The 7 SMA line **must sit behind or touch the rejection wick**, and **must never cut through the candle body** 20, 24, 25.
- **Volume Condition**:
- If the setup initiates a brand-new leg after trend weakness, volume must expand 26, 27.
- If the setup occurs mid-trend as continuation, volume should be lower than preceding impulse bars, indicating that institutional selling/buying pressure has dried up before the surge 26-28.
- **RSI Momentum Surge Filter**:

- Candle completion coincides with 14-period RSI pushing into **Overbought (\\(>70\\))** for Longs or **Oversold (\\(<30\\))** for Shorts 19, 29-31.
- **Trigger Placement**:
- **Long Entry Trigger**: Place a Stop-Buy (Market) order at \\(\text{High} + \epsilon\\) of the Candle Setup 27, 32.
- **Short Entry Trigger**: Place a Stop-Sell (Market) order at \\(\text{Low} - \epsilon\\) of the Candle Setup 27.
- **Cancellation Rule**: If the price closes beyond the opposite extreme (invalidation level) before triggering, cancel the order 33.

B. Resistance & Consolidation Box Breakout Setup

- **Touch Count Constraint**: Requires at least **3 distinct touches** against a horizontal key level without rejection extending deep into the opposite side 34-37.
- **Contracting Volatility / Volume**: Volume within the consolidation box must dry up toward the apex/boundary before the breakout 37-40.
- **Order Book Alignment**: Inspect the order book to ensure the Stop-Buy trigger is situated **above** the heaviest cluster of ask/limit sell walls to exploit the subsequent cascading liquidation vacuum 41-43.

C. 3-SMA Trend Alignment Engine

- **Indicators**: 7 SMA, 25 SMA, 99 SMA 17, 44.
- **Trend Filter**:
- Long trades: Price \\(> 7\text{ SMA} > 25\text{ SMA} > 99\text{ SMA}\\) 45, 46.
- Entanglement filter: When 7, 25, and 99 SMAs frequently cross and intertwine, classify the market as choppy/trendless and halt execution 47.

3. Mathematical Risk Management & Position Sizing

A. Dynamic Position Sizing Formula

\\\text{Margin / Position Size} = \frac{\text{Account Capital} \times \text{Risk \%}}{|\text{Entry Price} - \text{Stop-Loss Price}| \times \text{Leverage}}\\
Where:

- **Account Risk Per Trade**: **\\(0.25\%\\) to \\(0.50\%\\)** of total equity (maximum \\(1.0\%\\) for tier-1 confluence) 48-50.
- **Losing Streak Governor**: If losing streak reaches 3–4 consecutive stops, downshift risk automatically to \\(0.25\%\\) until profitability resumes 51, 52.
- **Leverage Boundary**: Adjusted so that the total distance to the stop-loss never exceeds the liquidation threshold 50.

B. Systematic Trade Management & Profit Harvesting ("Zanjire-ye Sood")

1. **\\(R:R < 1:2\\)**: Strict prohibition on manual closing or profit taking below \\(1:2\\) Risk-to-Reward 53, 54.

2. **At \\(2R\\) (\\(+2\times \text{Risk}\\))**: Close **\\(35\%\\)** of the original position volume. Move Stop-Loss to Breakeven **only if** a new valid structural pivot low/high has formed 55, 56.
3. **At \\(5R\\) (\\(+5\times \text{Risk}\\))**: Close **\\(40\%\\)** of initial volume 55, 57.
4. **At \\(10R\\) (\\(+10\times \text{Risk}\\))**: Close **\\(20\%\\)** of initial volume 55, 58.
5. **The Profit Chain (\\(5\%\text{–}10\%\\) Runner)**: Keep the final \\(5\%\text{–}10\%\\) open indefinitely, trailing the Stop-Loss behind structural swing points on the 4H/Daily chart to capture \\(20R\text{–}40R+\\) macro trends 58-60.

Systematic Outlining: Videos 1 Through 10

To ensure every video's distinct concepts, mechanics, and rules are systematically documented, here is the granular breakdown of the foundational block:

Video 1: "نقشه راه ترید ارزدیجیتال" (Crypto Trading Roadmap)

- **Core Concept**: The reality of the trading learning curve and systematic survival 61, 62.
- **Rules & Constraints**:
- Never risk more than an initial small capital account while developing an edge 62, 63.
- Define strict personal operational rules: no trading within 1 hour of waking up, no mobile execution, and trading strictly in a designated desk environment 54.
- The strategy must fit onto a single napkin—excessive complexity creates decision paralysis 64.
- Compulsory daily journaling via a structured spreadsheet 54.

Video 2: "آموزش تریدینگ ویو Tradingview" (TradingView Setup)

- **Core Concept**: Charting workspace configuration and avoiding cognitive clutter 65.
- **Rules & Constraints**:
- Maintain clean charting templates without multi-colored indicator overlays 65.
- Program price alerts at pre-breakout levels rather than staring at live ticks 65.
- Utilize the bar replay feature for systematic historical backtesting of specific candlestick reactions 65.

Video 3: "راحت ترین استراتژی ترید داو تئوری" (Dow Theory Trading Strategy)

- **Core Concept**: Structural trend definition via Higher Highs (HH) / Higher Lows (HL) and Lower Highs (LH) / Lower Lows (LL) 66, 67.
- **Algorithmic Mechanics**:
- **Bullish Trend**: Price breaks the previous swing High. Stop-Loss is placed below the preceding swing Low 66.
- **Bearish Trend**: Price breaks the previous swing Low. Stop-Loss is placed above the preceding swing High 67.
- **Execution Hybrid**: Entry and stop sizing are calibrated on the 15-minute timeframe, while the structural swing progression is monitored on the 4-Hour chart 15.

Video 4: "آموزش حمایت و مقاومت" (Support and Resistance Fundamentals)

- **Core Concept**: Classical horizontal price boundaries and breakout validation 68.
- **Algorithmic Mechanics**:
- Map major horizontal levels on Weekly and Daily timeframes first 68.
- Identify polarity flips: old resistance transforming into new support after an upward breach, and vice-versa 68.
- Avoid trading predictive turning points inside the middle of ranges; focus on boundary reactions 68.

Video 5: "هرچی از حمایت و مقاومت میشناسی بنداز دور" (Dynamic S/R Refinement)

- **Core Concept**: Prioritizing recent market information over distant historical levels 69.
- **Algorithmic Mechanics**:
- **Right-Hand Recency Rule**: Recent touches and boundary tests take precedence over touches from months prior 69.
- **Single Line vs. Zones**: Use clean, definitive horizontal levels calibrated to the most recent candle body closes rather than broad, ambiguous shaded boxes 14, 70.
- Target selection: Use the nearest resistance for take-profit targets, but require confirmation beyond distant structural levels for safe entries 71.

Video 6: "حدضرر تنها راه نجات" (Stop Loss: The Only Lifesaver)

- **Core Concept**: Structural placement and invalidation-based stop locations 72, 73.
- **Algorithmic Mechanics**:
- In Long trades, place the stop structurally below the prior valid swing low, not at an arbitrary dollar amount 74.
- If entering on indecision/breakout candles, the stop is anchored directly beyond the opposite extreme wick 75.
- **The Invalidation Rule**: A stop level must represent the exact price point where the directional thesis is completely broken and an opposite trade would theoretically be valid 73.

Video 7: "مدیریت سرمایه ، مدیریت ریسک ، ریسک به ریوارد ، وین ریت" (Capital & Risk Management)

1. **Core Concept**: The mathematical relationship between Win Rate, Risk-to-Reward, and trade classification 76, 77.
2. **Algorithmic Mechanics**:
3. Average system target: \\(1:5\\) R:R, with a hard minimum of \\(1:2\\) 78.
4. **Trade Quality Tiers**:
5. *High Risk / Early Trigger*: \\(0.25\%\text{–}0.50\%\\) risk (pre-breakout confirmation or fewer checklist points) 79.
6. *Standard / Normal Setup*: \\(0.50\%\text{–}0.75\%\\) risk (meets primary breakout and trend conditions) 80.
7. *High Conviction*: Up to \\(1.0\%\\) risk (full multi-timeframe and dominance alignment) 50, 81.

Video 8: "بهترین اندیکاتور ارزدیجیتال | مدیریت سرمایه TCP" (TCP Risk Calculator)

- **Core Concept**: Quantitative execution scripting and position size automation 50.
- **Algorithmic Mechanics**:
- Automatically calculate required contract margin based on entry, stop distance, account equity, and target risk percentage 50.
- Enforce maximum leverage ceiling: if the stop distance is \\(8\%\\), leverage cannot exceed \\(10\times\\); if the stop distance is \\(4\%\\), leverage cannot exceed \\(20\times\\) to avoid liquidation prior to stop execution 50.

Video 9: "کندل شناسی بر اساس پرایس اکشن" (Price Action Candlestick Logic)

- **Core Concept**: Reading buyer and seller balance of power rather than memorizing textbook names 82, 83.
- **Algorithmic Mechanics**:
- Dissect candlestick components: Open, High, Low, Close (OHLC) as an ongoing auction battle 83.
- A long top wick denotes aggressive seller absorption; a long bottom wick denotes aggressive buyer defense 84.
- Multi-timeframe synthesis: Two consecutive 15-minute candles merge into a single 30-minute structural pin bar or engulfing unit 33.

Video 10: "هرچی از کندل شناسی میشناسی بنداز دور" (Advanced Candlestick Demystification)

- **Core Concept**: Rejection of pattern taxonomy in favor of momentum and context 82, 85.
- **Algorithmic Mechanics**:
- Candlestick signals are meaningless in isolation; their validity depends strictly on location relative to macro S/R and higher timeframe momentum 82, 83.
- Measure body size progression: expanding real bodies in the direction of the break denote authentic institutional drive, while diminishing bodies entering resistance signal exhaustion 84, 86.

Proposed Outlining Roadmap for Videos 11 to 94

To process the remaining 84 videos with identical algorithmic precision, the playlist naturally groups into the following modular blocks:

1. **Batch 2 (Videos 11–20)**: Crypto Market Dominance (BTC.D, USDT.D, TOTAL2/3), RSI Integration, Bollinger Bands on Oscillators, and Probability Distributions 87-92.
2. **Batch 3 (Videos 21–30)**: Breakout Confirmations, Trend Analysis, Trend Weakness & Multi-Timeframe Volume Dynamics 84, 86, 93-97.
3. **Batch 4 (Videos 31–43)**: Volume Price Action, The 3-SMA System (7/25/99), The Core "Candle Setup" Suite, and Order Book Tape Reading 19, 44, 98-106.
4. **Batch 5 (Videos 44–56)**: The 8 Methods of Oscillators (RSI, Bollinger on RSI, Multi-Timeframe Multiplier Factor MF, ADX/DMI Momentum Filter) 107-118.
5. **Batch 6 (Videos 57–64)**: Pivot Points, Altcoin Pairing (ETH/BTC), Written Trading Plans, Futures Workflow, and Market Cycle Framework (HWC/MWC/LWC) 13, 119-124.

6. **Batch 7 (Videos 65–80)**: Advanced Order Execution (Stop-Buy/Stop-Sell mechanics), Momentum Capturing, The Pre-Trade Checklist, Dynamic Capital Growth, and Fibonacci Structural Waves 125-135.
7. **Batch 8 (Videos 81–94)**: TensorCharts Order Books, Reversing Engineering Algorithms, Scenario-Based Trading, and Whale Stop Hunting 2, 3, 136-143.

Would you like to proceed directly with **Batch 2 (Videos 11 through 20)**, or would you prefer to focus first on formalizing pseudo-code / mathematical logic for the **Candle Setup** and **Order Execution Engine**?
