Here is the algorithmic extraction and detailed breakdown for **Batch 2 (Videos 11 through 20)** of the Trade City Pro technical analysis series.
(Note: The creator omitted a standalone "Part 16" in the playlist sequence; hence, this 10-video batch covers Parts 11 through 21).

Video 11: "هرچی از ترید میشناسی بنداز دور بر اساس پرایس اکشن کندل شناسی ار تی ام" (Part 11)

- **Core Concept**: Eliminating textbook over-optimization, fantasy projections, and the urge to catch every micro-swing 1, 2.
- **Algorithmic Mechanics & Execution Filter**:
- **No Swing-Greed Algorithm**: An algorithm must never attempt to catch every internal 15-minute fluctuation (e.g., buying a dip, flipping to short, flipping to long immediately) 2, 3. Attempting to trade both sides continuously degrades expectancy due to spread, churn, and false reversals 3, 4.
- **Acceptance of Missed Moves**: The system only executes when pre-defined invalidation criteria are met; if a move runs without triggering an authorized entry, it is ignored rather than chased 2, 4.
- **Win-Rate Calibration**: Realistic long-term win rates for this breakout/trend framework sit between **50% and 75%** (higher in trending environments, lower in chop) 4, 5. Systems requiring 90%+ win rates rely on hidden blow-up risks or lack realistic stop losses 4, 6.

Video 12: "استراتژی دامیننس ها در بازار ارزدیجیتال دامیننس ها هک کریپتو" (Part 12)

- **Core Concept**: Quantitative macro-market flow modeling using Dominance ratios (BTC.D, USDT.D, ETH.D, TOTAL2, TOTAL3) and BTC/ETH trading pairs to select high-beta crypto assets 7-11.
- **System Metrics & Definitions**:
- BTC.D: Market cap weighting of Bitcoin relative to the top 125 cryptocurrencies 8, 9.
- USDT.D: Aggregate stablecoin market share (inversely correlated with overall market directional drive) 9, 12.
- Pairing Multipliers: Evaluating an asset against both USD (ALT/USDT) and Bitcoin (ALT/BTC) 11, 13, 14.
- **Algorithmic Regime Matrix (Asset Allocation Engine)**:
- **Regime A (BTC-Led Bull Move)**:
- *Condition*: BTC/USDT Trend is Up **AND** BTC.D Trend is Up 15-17.
- *Directive*: Direct margin to BTC Longs only; avoid Altcoin Longs as Bitcoin captures capital disproportionately 15-17.
- **Regime B (Altcoin Explosion / Altseason)**:
- *Condition*: BTC/USDT Trend is Up (or stable/ranging) **AND** BTC.D Trend is Down 13, 14, 18.
- *Directive*: Scan for Altcoins whose ALT/BTC charts have completed bullish breakouts 14, 18. These offer significantly larger momentum multipliers than Bitcoin itself 13, 19.
- **Regime C (Severe Altcoin Flush / Liquidation)**:
- *Condition*: BTC/USDT Trend is Down **AND** BTC.D Trend is Up 14, 15, 20.

- *Directive*: Do not short Bitcoin; target high-beta Altcoins whose ALT/BTC pairs are breaking down below support, as they will experience amplified selling pressure 14, 15, 20.
- **The Ultimate Long Sieve (Triple Confluence Filter)**:
- A Tier-1 Altcoin Long requires: ALT/USDT Bullish Breakout + ALT/BTC Bullish Trend + ALT/ETH (or ETH/BTC) Bullish Trend 18, 19.

Video 13: "اندیکاتور RSI" (Part 13)

- **Core Concept**: Momentum velocity and multi-timeframe breakout confirmation rather than counter-trend mean reversion 21-23.
- **Mathematical Calibration**:
- Relative Strength Index (RSI) configured to standard 14 periods on candle Close 24-26.
- **Algorithmic Rules & Invalidation Logic**:
- **Prohibition of Overbought Shorting**: Never initiate a short trade simply because RSI > 70 22, 23. An RSI entering Overbought (>70) is programmatic evidence of explosive institutional momentum 22, 23.
- **RSI Trend Alignment Cascade**: High-momentum macro extensions occur sequentially: RSI crosses >70 on 15m, then 1h, then 4h, and finally the Daily chart 22, 23. When 15m RSI is already overextended (>70) and entry was missed, step up to the 1h or 4h chart and wait for that higher timeframe bar to close >70 before triggering 22, 23.
- **Trendline / Structural Breakouts on RSI**: Chart patterns and horizontal boundaries can be drawn directly on the RSI curve 22, 27. When the RSI breaks its resistance level before price breaks its physical resistance, treat it as an early momentum trigger 27.

Video 14: "اندیکاتور بولینگر بند bollinger band" (Part 14)

- **Core Concept**: Dynamic volatility bands (SMA 20, 2 Standard Deviations) used as directional momentum riders and volatility squeeze indicators 28-30.
- **Algorithmic Mechanics**:
- **Directional Envelope**:
- If Higher Timeframe Trend is Up: Take Buy triggers when price touches/rejects the lower band or crosses above the 20-period middle line; never take Short signals 31.
- If Higher Timeframe Trend is Down: Take Sell triggers on touches/rejections of the upper band or crosses below the middle line; never take Long signals 31.
- **Squeeze & Expansion Engine**:
- When Bollinger Band bandwidth contracts to cyclical lows (upper and lower bands become horizontal and narrow), flag volatility compression 32, 33.
- **Trigger**: A decisive candle close outside the band (e.g., closing above the upper band after a squeeze) signals an institutional expansion; open a momentum position in the direction of the break 31-33.
- **Double Bollinger Band Protocol**:
- Overlay two Bollinger Bands: Band 1 at 1.0 Standard Deviation, Band 2 at 2.0 Standard Deviations 34.

- The channel between 1.0 SD and 2.0 SD defines the "Momentum Runway"; remain in the trade as long as candles continue closing within this band 34, 35.

Video 15: "استراتژی ترید BB & RSI" (Part 15)

- **Core Concept**: Sub-window technical overlay placing Bollinger Bands directly onto the RSI oscillator (BB on RSI) 36-38.
- **Algorithmic Mechanics**:
- **Parameters**: Base RSI (14, Close) inside which a Bollinger Band (20, 2 StdDev) is computed 38.
- **RSI Midline (50) Filter**: The 50 level on RSI is not used as a naked trigger; RSI > 50 indicates an overall bullish bias, while RSI < 50 indicates a bearish bias 39.
- **Entry Trigger (Re-entry in Established Trends)**:
- In an established 4H uptrend, if price experiences a minor pullback that causes RSI to dip into the lower Bollinger Band on the oscillator:
- **Trigger**: Wait for the RSI line to curl back up and cross **above the middle line (SMA 20) of its own Bollinger Band** 40, 41.
- Cross above the BB-RSI midline provides the algorithmic confirmation to trigger an entry in the direction of the macro trend, accompanied by a price action candle confirmation 40, 41.

Video 16: "تنها راز موفقیت ترید , درک احتمال" (Part 17)

- **Core Concept**: Probabilistic edge, statistical sample sizes, and Mark Douglas's random distribution theory 42, 43.
- **Algorithmic Implications**:
- **Random Outcome Distribution**: For any proven algorithmic edge (e.g., 55% win rate with 1:5 R:R), the distribution of wins and losses over the next 100 trades is completely random 42-44.
- **No Single-Trade Conviction**: An algorithm must treat every individual trade as a random event while trusting the cumulative probability curve over \\(N \ge 100\\) executions 43, 44.
- **Streaks and Governors**: Systems must be programmed to handle 5 to 7 consecutive losing trades without altering the core rules or blowing through drawdowns 43, 44.

Video 17: "استراتژی که در ماه گذشته ۹۵۰۰۰ دلار سود – استراتژی KBSM" (Part 18)

- **Core Concept**: Demystifying trading scams, satirical "KBSM" (Kolah-Bardari / Showmanship) systems, and addressing manipulated exchange trading logs 45-47.
- **Algorithmic Reality Check**:
- **Rejecting "100% Win Rate" Illusions**: Any strategy claiming zero losing trades or "guaranteed sniper wick predictions" is fraudulent marketing 45, 47, 48.
- Real automated edge is built entirely on mathematical expectation, stop-loss discipline, and risk-to-reward ratios, not guessing exact future price points 46, 47, 49.

Video 18: "زور خریدار و فروشنده مسئله این است بر اساس پرایس اکشن" (Part 19)

- **Core Concept**: Auction market theory—evaluating the relative force of Market Orders (Aggressors / Takers) versus Limit Orders (Passive Liquidity / Makers) 50-52.
- **Algorithmic Evaluation of Chart Patterns**:
- **Ascending Triangle vs. Double Top**: When analyzing continuation and reversal structures, the strength of the breakout is determined by the reaction off opposing boundaries 52-54.
- **Cup and Handle Mechanics**: A Cup and Handle where the handle retraces shallowly (holding the upper 1/3 of the cup) indicates aggressive limit buying absorbing all available supply, making a breakout significantly higher probability than a deep, sluggish handle 54.
- **Pattern Invalidation Metric**: If an asset fails to push off a support line quickly and instead hugs the boundary with small candles, the passive bids are being depleted by market sells, preceding a downward structural flush 54, 55.

Video 19: "هر چی از سیو سود میشناسی بنداز دور صفر تا صد سیو سود در ارزدیجیتال" (Part 20)

- **Core Concept**: Systematic trade scaling, mathematical profit taking ("Zanjire-ye Sood" / The Profit Chain), and avoiding premature position liquidation 56, 57.
- **Algorithmic Trade Management Protocol**:
- **Minimum Threshold Filter**: The algorithm is hard-coded never to close an entire position below a \\(1:2\\) Risk-to-Reward (\\(2R\\)) 57, 58.
- **Tiered Take-Profit Ladder**:
- **At \\(+2R\\)**: Close **35%** of the position volume 57. Move the Stop-Loss to Breakeven **only if** a structural pivot has formed 59.
- **At \\(+5R\\)**: Close an additional **40%** of initial position volume 57.
- **At \\(+10R\\)**: Close an additional **15%** of initial volume 59.
- **The Runner (10% Volume)**: Retain 10% of the position open indefinitely with a trailing stop anchored behind higher timeframe (4H/Daily) structural swing lows/highs to capture \\(20R\text{–}40R+\\) secular trend extensions 56, 58, 59.
- **Counter-Trend Deviation**: If the algorithm takes a counter-trend trade (e.g., trading a pullback in a higher-timeframe trend), all runners are disabled: close 100% of the position strictly at \\(2R\\) or at the first structural boundary 58, 60.

Video 20: "شکست و تثبیت حمایت و مقاومت بر اساس پرایس اکشن" (Part 21)

- **Core Concept**: Defining exact, programmatic breakout and stabilization rules to eliminate fakeouts 61-63.
- **Algorithmic Rules for Breakout Confirmation**:
- **The Body Close Rule**: A breakout is valid **only** when the full candle real body closes beyond the horizontal boundary (a wick penetrating the level is classified as a sweep/test, not a breakout) 63.
- **Touch-Count Constraint**:

- **1st Touch**: Breakout on the first attempt is classified as high-risk/unreliable; do not execute 63, 64.
- **2nd Touch**: Still elevated risk; requires explicit whale/volume confirmation candle 63, 64.
- **3rd & 4th Touch**: Optimal breakout window; institutional liquidity has absorbed the opposing limit walls, maximizing the probability of a momentum continuation 63.
- **Volume & Rejection Sizing**: A breakout candle must have an above-average real body closing near its extreme, confirming that passive orders were exhausted and market orders are cascading through the spread 64.

💡 *Next up in the sequence is **Batch 3 (Videos 21 through 30)**, which details Trend Health Analysis, Candlestick Sizing Dynamics, Multi-Timeframe Confirmation Filters, and Volume/Open Interest mechanics. Let me know when you're ready to proceed with those.*
